MS SQL Server

Rescue Service

High level MS SQL Server competence.
We can help you if an accident occurs,
or your MS SQL is inexplicably down.

The Digital Lifesaver

Many rescue operations on MS SQL Servers which performed poorly or could not be brought to normal production mode have built both experience and confidence with our Professional Services Team.

Experienced disaster action

When a disaster occurs, there is no room for feeble assumptions. Only "hardcore" knowledge counts. The requirement for MS SQL Rescue involves multiple competences and experience to accomplish success.

Solve a problem or think ahead

Through many years of consultancy-tasks with MS SQL Servers in both private companies and public institutions, we have built up a solid level of competence that you can benefit from, whether and accident occurs – or you just want to stay ahead of a disaster situation.

Rather prevention than chaos

If you are in doubt whether your MS SQL Server is robust and actually can be recovered after a breakdown, we recommend that you begin by preventing a disaster situation. We will help you detect risks to your setup and conduct test in controlled recovery scenario.

Alternatives to breakdowns

The right database design, configuration tuning and ongoing maintenance is the way to avoid breakdowns and poor performance.

Fine tuning and optimization

The MS SQL Server is an instrument that can play equally beautifully and out of tune. Fine tuning will add more power to the database's "engine room" and gives your colleagues faster completion of the corresponding programs.

Arrange a SKYPE meeting to hear more about our experience, solutions and cost assessment.

MS SQL Rescue - Start to End

We have a clear approach. Rescue as much as possible as fast as we can.

1. Problem Analysis

The first phase the focus is on finding the reason for the breakdown. Once the problem has been identified and clearly defined, the solution options are presented and evaluated to get the best possible result.

2. Close cooperation

Direct dialog between you, IT-staff, management and our consultant gives the best result if the given conditions are to choose from two evils. Throughout the process, we will provide you with information on progress and challenges. We will continuously keep you up-to-date.

3. Securing the future

The final rescue evaluation will be documented for detecting source and plan action for the future.

If an accident has occured – look here!

If the situation has gone wild, there is rarely time to plan and prepare – in these situations it is all about analyzing problems and detecting the possible rescue scenarios.

Call and book – we will get there as soon as possible.

Our expert will contact you as soon as possible and inform you what conditions, administrator-accounts and potential persons, needed to start the problem analysis. Remote Access can shorten the time and provide a faster response to the extent of the problem.

Order a "MS SQL Rescue Service" label to put on the server or in the operating room on: jfr@miranda.dk
